

A photograph of the Monterey Bay Aquarium building, a large concrete structure with a balcony overlooking the ocean. The building has large glass windows and a balcony with a railing. In the foreground, there are large, brown, rounded rocks. The water is blue and clear, showing some green algae or seaweed on the rocks. In the background, there are mountains under a clear blue sky. The text is overlaid on the left side of the image.

The mission of the Monterey Bay Aquarium is to inspire conservation of the oceans.

Hot Pink Flamingos

Stories of hope
in a Changing Sea

Cynthia was shocked to discover her lunch contributed to climate change.

UNDER WATER

ELI WARD THORNTON

Iceless Arctic

Research indicates that by 2050, the Arctic region will be ice-free for much of the year. This means that polar bears will have less time to hunt for their main food source, seals. As a result, their numbers are expected to decline significantly.

With less ice, polar bears will have to travel further to find food. This will increase their energy expenditure and reduce their ability to survive in the harsh Arctic environment. Conservation efforts are needed to protect these magnificent animals from the effects of climate change.
